

Part 6: Test Levels

1. Definitions of Test Levels

Unit Testing

Test individual pieces of code (e.g., functions, methods) in isolation to ensure they work correctly.

Integration Testing

Verify how multiple units or modules work together to ensure data flow and interaction between components is correct.

System Testing

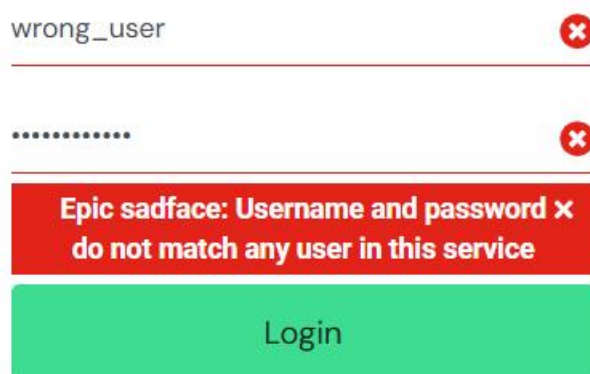

Testing the complete, integrated system as a whole to verify that it meets specified requirements end-to-end.

Acceptance Testing

Final testing performed to confirm system meets business requirements and is ready for delivery to users (often validated by clients or end users).

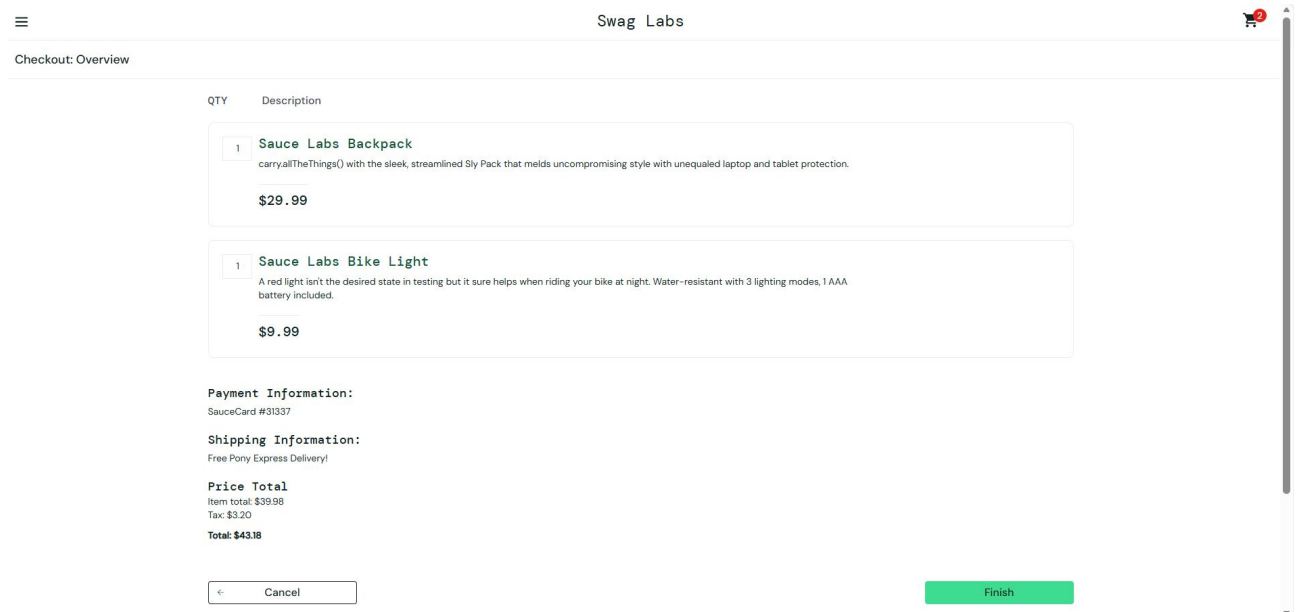

SauceDemo

Unit testing(Log in function) -Verify that the login validation function correctly accepts valid credentials and rejects invalid ones.

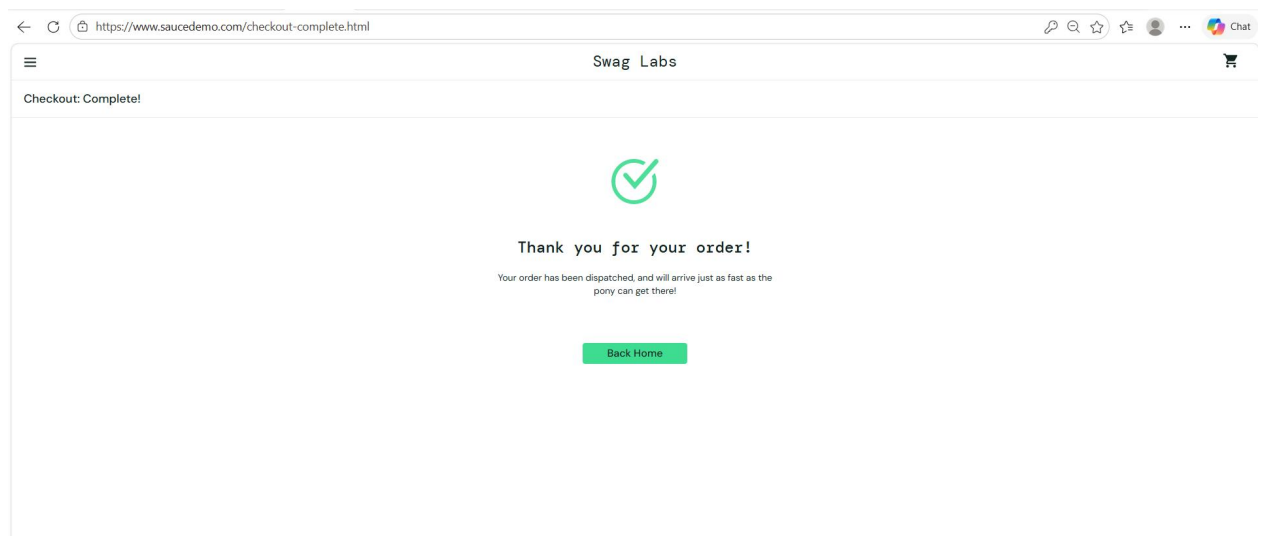

The screenshot shows a login form with two input fields. The first field, labeled 'wrong_user', contains the text 'wrong_user' and has a red 'X' icon to its right. The second field, which is a password field with dots, also has a red 'X' icon to its right. Below these fields is a red error message box that reads: 'Epic sadface: Username and password do not match any user in this service'. At the bottom of the form is a green 'Login' button.

Integration Testing - Verify that items added to the cart are correctly passed to the checkout page and reflected in the total price calculation.

System Testing

Verify the full user journey: login → browse products → add to cart → checkout → order confirmation.

Acceptance Testing

Confirm that an end user can successfully complete a purchase and receive a correct order confirmation email, meeting business requirements.

RosarioSIS

Unit testing(Log in function) -Verify that the login validation function correctly accepts valid credentials and rejects invalid ones.
